If your control system is incapable of limiting fuel flow to prevent the exhaust temperature from exceeding 950F, be advised that GE provided for manual control of its early gas turbines (years from 1960 to 1980). In the decade of the 1960s, GE gas turbines used the Young & Franklin fuel regulator for engine control. In the early 1970s, Speedtronic became the electronic control and protection system of choice.

Aeroderivative, industrial and heavy-duty gas turbines up to 593 MW Whatever your business challenges may be, our gas turbines are precisely designed to master the dynamic energy market environment. Low lifecycle costs and an excellent return on investment right from the start are just two of the benefits that our gas turbine portfolio offers.

The gas turbine generator is a combination system of a compressor, turbine, and generator. First of all, the air intake is compressed by the compressor. This compressed air will be heated by a fuel combustion process. This hot and high-pressure air will be expanded in the turbine so that the turbine is rotating and producing a thrust force.

TurbineProtect combines industrial fire detectors and fire detection systems and suppression control with various fire protection technologies such as: CO2 High and low-pressure fire extinguishing systems, Oxeo inert gas fire extinguishing systems (with argon or nitrogen), Minifog ProCon XP high-pressure water mist suppression systems. This enables a reliable integrated fire protection solution that can be individually customised to the requirements on site.
