Protein-protein interaction networks. Protein-protein interactions (PPIs) are essential to almost every process in a cell, so understanding PPIs is crucial for understanding cell physiology in normal and disease states. It is also essential in drug development, since drugs can affect PPIs. Protein-protein interaction networks (PPIN) are mathematical representations of the physical contacts between proteins in the cell.

Protein-protein interaction networks | Network analysis of ...

Protein–protein interaction (PPI) networks describe physical interactions between proteins, taking place to mediate the assembly of proteins into protein complexes, or e.g., mediating signaling/regulation and transport events in the cell. Genetic interaction (GI) networks deal with pairs of proteins for which there is information that they interact functionally (i.e., the absence or presence of both proteins has a synergetic effect on the cell physiology/phenotype).

Protein-Protein Interaction Networks - an overview ...

Studying the topological structure (not to be confused with molecular structure) of protein–protein interaction networks is a hot topic in systems biology research. In such a network, proteins are represented as vertices, and interactions between protein pairs are represented as edges.

Protein-Protein Interaction Networks - an overview ...

The Protein-Protein Interactions Network (PPI-Net) is a new National Network for Protein-Protein Interactions starting April 2011. The Network was jointly funded by Engineering and Physical Science Research Council (EPSRC), Biotechnology and Biological Sciences Research Council (BBSRC), and the Medical Research Council (MRC) from April 2011 to November 2013.

This volume explores techniques that study interactions between proteins in different species, and combines them with context-specific data, analysis of omics datasets, and assembles individual interactions into higher-order semantic units, i.e., protein complexes and functional modules. The chapters in this book cover computational methods that solve diverse tasks such as the prediction of functional protein-protein interactions; the alignment-based comparison of interaction networks by SANA;

Protein-Protein Interaction Networks | SpringerLink

Protein–protein interactions (PPIs) are physical contacts of high specificity established between two or more protein molecules as a result of biochemical events steered by interactions that include electrostatic forces, hydrogen bonding and the hydrophobic effect. Many are physical contacts with molecular associations between chains that occur in a cell or in a living organism in a specific biomolecular context.

Protein–protein interaction information can already be retrieved from a number of online resources. First, primary interaction databases (e.g. 9–13) which are largely collaborating (14, 15) provide curated experimental data originating from a variety of biochemical, biophysical and genetic techniques.

The study of modules is also useful when defining intermodular interactions and proteins. These are the edges/nodes that link different communities within a network. They can act as switches or high-level modulators that, for example, mediate cross-talk between different complexes or pathways.

Protein interaction networks have been used to predict the function of proteins of unknown functions. This is usually based on the assumption that uncharacterized proteins have similar functions as their interacting proteins (guilt by association).

Interactome - Wikipedia

Genome wide protein networks have become reality in recent years due to high throughput methods for detecting protein interactions. Recent studies show that a networked repre- sentation of proteins provides a more accurate model of bio- logical systems and processes compared to conventional pair- wise analyses.

It integrates protein-protein interaction (PPI) data from public curated databases and builds a complete, non-redundant protein interaction dataset for six model organisms. In particular, it provides a variety of built-in tools to filter and analyze the networks for gaining biological and functional insights into the network.
